# Overview

- Motivation
- Classification
- Query type
- Algorithms
- Examples
- Research directions

Simulation for Medical Training – MICCAI 2003

# Motivation

- Need to identify interaction between
  - Tool and tissue
  - Tissue and tissue
  - Tool and tool
- Interactions include
  - Contact
  - Penetration
  - Proximity

Simulation for Medical Training – MICCAI 2003

# A Simple Collision Detection Algorithm

- for object\_1 in {all objects}
  - for object\_2 in {all objects}
    - » if collide(object\_1,object\_2)
      - add <object\_1,object\_2> to list
- Algorithm assumes
  - static environment
  - You actually want to detect collision

Simulation for Medical Training – MICCAI 2003

# Collision Detection in a Dynamic Environment

- Two broad classes
  - Detects collisions in continuous spatial-temporal domain
    - » Infinite spatial resolution
  - Detects collisions at discrete intervals in temporal domain
    - » Sampling must ensure collisions are not missed

Simulation for Medical Training – MICCAI 2003

# Query Types

- Intersection
  - Collide or not
  - Collision loci
  - Polygon(s) colliding
- Proximity
  - Finding the closest points/polygons
- Prediction
  - Time to collide
  - Priority list

Simulation for Medical Training – MICCAI 2003

## Brute Force Collision Detection

- Check for collisions between objects
  - Self collision
  - Tool-tissue collision
  - tissue-tissue collision
- Too much, need to prune list of objects/polygons to test

Simulation for Medical Training – MICCAI 2003

## Brute Force Collision Detection

- Check for collisions between objects
  - Self collision
  - Tool-tissue collision
  - tissue-tissue collision
- Too much, need to prune list of objects/polygons to test

Simulation for Medical Training – MICCAI 2003

## Collision Detection

- Needs to be done often
  - Every time tools/organs/tissues change position or deform
  - Must be fast
    - » Both visual and haptic rendering
- Types of collisions
  - Tool/tool
  - Tool/tissue
  - Tissue/tissue

Simulation for Medical Training – MICCAI 2003

## Detecting Collision Between Polyhedra

- Feature-based algorithms
  - Features can be vertices, lines, or faces.
- Iteratively converges to the closest feature pair on polyhedra being tested.
- Examples
  - Lin-Canny algorithm
    - » Computes closest features
    - » Linear in number of vertices
    - » Near-constant time if temporal coherence is used
  - V-Clip
    - » Permits penetrating objects, more robust

Simulation for Medical Training – MICCAI 2003

## Detecting Collision Between Polyhedra

- Gilbert, Johnson and Kerrthi Algorithm
  - GJK and enhanced GJK
- Based on techniques in linear programming
- Estimates of penetrating distance possible
  - Uses temporal coherence to run in near constant time

Simulation for Medical Training – MICCAI 2003

## Bounding Volumes

- Not cost effective to track distant objects
- Many collision detection libraries use a two-level approach to detecting collisions.
  - Prune uninteresting objects
    - » Too far away
    - » No colliding for next “n” time steps
  - Check for collision between likely objects only
    - » Check between polytopes
    - » Check specific polygons between objects.

Simulation for Medical Training – MICCAI 2003

## Popular Pruning Methods

- Bounding volumes
  - Spheres
  - Boxes
    - » Static partition
    - » Axis aligned bounding boxes
    - » Separating Axis Theorem
- Hierarchy of volumes
  - Octrees
  - Sphere trees
  - OBBTrees

Simulation for Medical Training – MICCAI 2003

## Spheres

- Bound objects by spheres
- Fast, easy to compute
- Can be too conservative
  - Too many false positives if object is long and thin/flat
  - But see [HUBBARD93] and [HUBBARD96]

Simulation for Medical Training – MICCAI 2003

## Axis Aligned Bounding Boxes (AABB)

- I-Collide algorithm [COHEN95]
  - Boxes intersect if and only if projections to coordinate axes intersect
  - Uses temporal coherence
    - » Detects all possible intersections in expected linear time

Simulation for Medical Training – MICCAI 2003

## Axis Aligned Bounding Boxes (AABB)

- Inefficient for long thin objects at arbitrary orientations
- Boxes need to be continually resized for
  - rotating objects
  - deforming objects

Simulation for Medical Training – MICCAI 2003

## Oriented Bounding Boxes

- Oriented bounding boxes
- Smallest box that bounds object, not necessarily aligned to coordinate axes
- Separating Axis Theorem [GOTSCHALK96].
- Two polytopes are disjoint iff.
  - there exists an axis orthogonal to an edge in each polytope, or there exists an axis orthogonal to a face on one polytope

Simulation for Medical Training – MICCAI 2003

## Oriented Bounding Boxes

- For boxes, need to test at most 15 axes
  - Each box has 3 unique face and 3 unique edge orientations
  - Thus, 3 faces (on one box) + 3 faces (on the other box) + 9 edge combinations

Simulation for Medical Training – MICCAI 2003

## Static Partition

- Partition space into fixed sized boxes
- Build hash table mapping space to polygons
- Advantages
  - Fast (expected constant time)
  - Deformations easily handled
- Disadvantages
  - Memory overhead

Simulation for Medical Training – MICCAI 2003

## Hierarchy Of Bounding Volumes

- Need tighter fit with object
- Collision detection reduced to tree search
  - Typically  $O(\lg N)$  time
- Types of bounding volume hierarchies
  - Octrees [SAMMET98]
  - Sphere trees [HUBBARD93]
  - AABB Trees [BERGEN97]
  - OBB Trees [GOTTSCHALK96]

Simulation for Medical Training – MICCAI 2003

## Octrees [SAMMET98]

- Start with AABB encompassing entire object
  - Recursively subdivide box into four sub-boxes until a lower limit is reached
  - Relatively easy to construct
  - Updates are non-trivial
    - » Movement
    - » Deformation

Simulation for Medical Training – MICCAI 2003

## Sphere Trees [HUBBARD93]

- Instead of using boxes, use spheres
- Methods for building hierarchy
  - Octree subdivision [HUBBARD93]
  - Medial axis based [HUBBARD96]
  - Tighter subdivision [BRADSHAW02]

Simulation for Medical Training – MICCAI 2003

## AABB Trees [BERGEN98]

- Recursively subdivide AABB by partitioning along longest axis
  - Equal number of primitives on either side of partition
- Refit boxes after deformation
  - AABB of child AABBs is smallest AABB enclosing all primitives.
- Refitted boxes have more overlap than rebuilt boxes

Simulation for Medical Training – MICCAI 2003

## OBBTrees [GOTTSCHALK96]

- Recursively subdivide OBBs
  - Divide along longest/ $2^{\text{nd}}$  longest/shortest axis
  - Repeat division until not possible to divide on any axis
  - Use Separating Axis Theorem to determine intersection

Simulation for Medical Training – MICCAI 2003

## Bucket trees [GANOVELLI00]

- For each axis, maintain sorted list of polygon coordinates
- Use octree to partition space
- Leaves point to polygon with lowest coordinate value in each array
  - Each leaf contains a “bucket” of polygons

Simulation for Medical Training – MICCAI 2003

## Bucket trees

- When object deforms, polygons move to different bucket
  - Change pointer at leaves

Simulation for Medical Training – MICCAI 2003

Sphere trees	AABB Tree	OBB Tree	Bucket Trees
<ul style="list-style-type: none"> <li>• Rotationally invariant</li> <li>• Intersection test is very simple</li> <li>• Approximation to underlying object may be poor</li> </ul>	<ul style="list-style-type: none"> <li>• No need to rebuild tree for deformable objects</li> <li>• Easy to build</li> <li>• Relatively easy to test for intersections</li> <li>• Needs more intersection tests compared to OBB Tree (object dependent)</li> </ul>	<ul style="list-style-type: none"> <li>• Tight fit with underlying object</li> <li>• Faster</li> <li>• Relatively easy to test for intersections</li> <li>• Needs fewer intersection tests compared to AABB Tree (object dependent)</li> </ul>	<ul style="list-style-type: none"> <li>• Updating tree for deformable objects requires little effort</li> <li>• Tree can get unbalanced</li> </ul>
Efficient for rejection tests, less efficient for cases where multiple intersections exists			

Simulation for Medical Training – MICCAI 2003

## Hardware Based Collision Detection [LOMBARDO99]

- Dynamic collision detection
  - No need to take discrete samples in time
- No additional data structures
- Uses commonly available graphics hardware
  - OpenGL based
- Detects multiple contact points in one pass
- Runs at interactive frame rates
  - Depending on hardware

Simulation for Medical Training – MICCAI 2003

## Hardware Based Collision Detection [LOMBARDO99]

- Laparoscopic instrument moves about a pivot point
- At each time step, instrument moves in (nearly) a straight line.
- Volume swept out by instrument approximates a viewing frustum
- Use OpenGL define that frustum, then render
- Anything visible must be due to objects intersecting path of instrument

Simulation for Medical Training – MICCAI 2003

## Hardware Based Collision Detection [LOMBARDO99]

Using the Author's method:				
processor	R10000 195 MHz	DEC alpha 500 MHz	Pentium2 333MHz software (Linux Mesa)	Pentium2 333MHz 3Dfx Voodoo2 (Linux Mesa)
static	0.13 ms	0.09 ms	2.2 ms	1.7 ms
dynamic	0.16 ms	0.11 ms	3.0 ms	2.3 ms

Using the Obb tree method:			
processor	R10000 195 MHz	DEC alpha 500 MHz	Pentium2 333MHz
Precomputations	24.1 ms	15.7 ms	35.6 ms
static	0.63 ms	0.44 ms	1.0 ms
dynamic	0.76 ms	0.48 ms	1.2 ms

NB: *static* means considering a single position for the tool  
*dynamic* means considering the tool positions during a time interval

Simulation for Medical Training – MICCAI 2003

## Hardware-based Bounding Box Computation [AHARON02]

- Partition objects into AABBs
  - Each box has specified # of polygons
  - Resize boxes for deformable objects
- Use GL select mode to
  - Determine collision of bounding boxes
  - Determine polygon collisions
- Polygon collisions determined by building bounding boxes around polygons.

Simulation for Medical Training – MICCAI 2003

## Performance

- Experiments suggest
  - Less than linear time increase as polygons increase
  - Not very sensitive to # polygons per bounding box
- Fast update
  - Full AABB tree not required

Simulation for Medical Training – MICCAI 2003

## Open Questions

- Many, many points of contact
  - Organ/organ, Suturing, Palpation
  - Many current algorithms not efficient at solving this problem
- Deformation, change in topology
- Self collision
  - Knot tying
- Collision detection using a volumetric representation
- Need to do everything in real-time

Simulation for Medical Training – MICCAI 2003
