A Tutorial on Surgical Simulation: Past, Present, and Future – MMVR 2002

Outline

- Ability versus skill
- What to train
- How to train
- Assessment: performance metrics
- Validation

A Tutorial on Surgical Simulation: Past, Present, and Future – MMVR 2002

Ability Versus Skill

- Ability (capability or aptitude):
Ability...refers to a hypothetical construct that underlies (or supports) performance in a number of tasks or activities. An ability is usually thought to be a relatively stable characteristic or trait. [Schmidt & Lee, 1999]
- Skill:
 - Skills are learned or trained
 - Skill implies some coordinated physical or cognitive activity to achieve a goal
 - Skill implies flexible or adaptive performance [Patrick, 1992]

A Tutorial on Surgical Simulation: Past, Present, and Future – MMVR 2002

Ability: Fleishman's Taxonomy of Component Abilities

- Cognitive abilities
e.g., deductive and inductive reasoning, spatial orientation and visualization, selective attention
- Psychomotor abilities
e.g., control precision, reaction time, finger dexterity
- Physical abilities
e.g., strength, flexibility, coordination, stamina
- Sensory/perceptual abilities
e.g., visual acuity, color discrimination, depth perception

A Tutorial on Surgical Simulation: Past, Present, and Future – MMVR 2002

Skills: Gagne's Learning Outcomes

- Intellectual skills ("knowing that")
- Verbal information ("knowing how")
- Cognitive strategies
- Motor skills
- Attitudes

A Tutorial on Surgical Simulation: Past, Present, and Future – MMVR 2002

Analyzing Skills: Task Analysis

- Hierarchical task analysis (Cao et al., 1999)
- Task and motion studies (Cao et al., 1996)
- Critical incident technique
- Major limitation: difficult to analyze *implicit* (non-verbalizable) skills, such as spatial or perceptual-motor

A Tutorial on Surgical Simulation: Past, Present, and Future – MMVR 2002

Example of Hierarchy: Laparoscopic Cholecystectomy

- Prepare patient
- Isolate gallbladder
 - Locate visually
 - Grasp & elevate
 - » Poke
 - » Tease
 - Dissect surround
 - » Poke
 - » Tease
 - » Cut
 - » Cauterize
- Remove gallbladder
- Close

A Tutorial on Surgical Simulation: Past, Present, and Future – MMVR 2002

Rasmussen's Cognitive Hierarchy

- Skill-based level:
"sensory-motor skill"
"...continuous control of the movements required by the interaction with a work environment..."
- Rule-based level:
"... organization of the routine patterns of movements... into the proper procedural sequences."
- Knowledge-based level:
"problem solving level"
"...generation of plans to be used by the sequence controller for new situations."

A Tutorial on Surgical Simulation: Past, Present, and Future – MMVR 2002

Reason's Error Modeling System

- Skill-based errors: slips and lapses
 - Often due to inattention
 - Surgery usually robust to slips if caught in time
- Rule-based mistakes
 - E. g., following a rule that is usually correct, but fails in an anomalous situation
 - Bad rules

A Tutorial on Surgical Simulation: Past, Present, and Future – MMVR 2002

Reason's Error Modeling System

- Knowledge-based mistakes
 - Similarity matching
 - Frequency gambling
 - Selective attention
 - Confirmation bias
- Appropriate rules can be taught to reduce the likelihood of knowledge-based errors

A Tutorial on Surgical Simulation: Past, Present, and Future – MMVR 2002

Example: Bile Duct Injury During Laparoscopic Cholecystectomy

A Tutorial on Surgical Simulation: Past, Present, and Future – MMVR 2002

Critical Steps in Laparoscopic Cholecystectomy

- Use lateral traction on the infundibulum of the gallbladder during dissection
- Dissect the space between the gallbladder and cystic duct completely
- Clear the triangle of Calot enough to show the hepatic side of the infundibulum
- Use an angled scope to gain proper view of the triangle of Calot
- If the duct won't fit entirely within a 9mm clip, assume it is the common duct
- Any duct that look as if it goes behind the duodenum has to be the common duct

A Tutorial on Surgical Simulation: Past, Present, and Future – MMVR 2002

Issues in Training: Part- versus whole-task training

- Whole task best when interrelationship between task elements is complex
- Part task best when individual elements are difficult, but task organization straightforward

A Tutorial on Surgical Simulation: Past, Present, and Future – MMVR 2002

Issues in Training: Guidance

- Provided during task performance
- Various forms
 - Verbal guidance (advice)
 - Visual guidance (demonstration)
 - Physical guidance (haptic guidance)
 - Cueing

A Tutorial on Surgical Simulation: Past, Present, and Future – MMVR 2002

Issues in Training: Augmented Feedback

- Knowledge of results: feedback of outcome
 - E.g., “you took 7 minutes,” “you nicked the liver 3 times.”
- Knowledge of performance
 - E.g., “you used 30% too much force,” “you dragged the needle instead of driving a smooth arc.”
 - Difficult to measure objectively conventionally, but may be possible with measures feasible in simulation

A Tutorial on Surgical Simulation: Past, Present, and Future – MMVR 2002

Recognizing and Classifying User Behavior

- Sequence of position and/or force states: hidden Markov models
 - Rosen et al., 2001
 - Trochim et al., 2001
- Dynamic behavior recognition
 - Tendick et al., unpublished

A Tutorial on Surgical Simulation: Past, Present, and Future – MMVR 2002

Performance Metrics: Declarative Knowledge

- Declarative knowledge is explicit knowledge of facts, e.g.:
 - Anatomic landmarks
 - Indications and contraindications for a procedure
 - Physiological effects of surgical interventions
 - etc.
- Assessed via quiz or recognition tasks

A Tutorial on Surgical Simulation: Past, Present, and Future – MMVR 2002

Performance Metrics: Procedural Knowledge

- Explicit knowledge of how to perform a procedure, e.g.:
 - Sequence of navigation of anatomic landmarks
 - Steps of a surgical intervention
 - Proper use of surgical instrument (e.g., “see both tips of a surgical clip applier before securing clip”)
 - Dealing with unusual situations
 - » Like losing an engine in flight simulation
 - » Difficult anatomy in laparoscopic cholecystectomy
- Can be expressed verbally, but may depend on non-verbal (e.g., visual or haptic) information
- Traditionally tested verbally, but can be assessed in simulation using realistic environment

A Tutorial on Surgical Simulation: Past, Present, and Future – MMVR 2002

Performance Metrics: Implicit Knowledge

- Difficult or impossible to verbalize, e.g.:
 - Visual recognition of anatomic features
 - Performance of a perceptual-motor skill
 - Tactile recognition of tissue condition
 - Integration of spatial information from one or more imaging modalities, e.g. ultrasound, endoscope, etc.

A Tutorial on Surgical Simulation: Past, Present, and Future – MMVR 2002

Performance Metrics: Perceptual Skills

- Examples:
 - Recognition: what is this?
 - Accuracy: which of these images is correct?
 - Identification: is this diseased or healthy?
 - Navigation: find this landmark
- Can be assessed in “realistic” situation in simulation, with limited information possible, e.g. in minimally invasive surgery
- Augmented knowledge of performance possible, e.g. with “bird’s eye” view of endoscope location

A Tutorial on Surgical Simulation: Past, Present, and Future – MMVR 2002

Performance Metrics: Perceptual-Motor Skills

- Examples:
 - Guidance of an endoscope in the colon
 - Simple laparoscopic motor skills: two-handed manipulation
 - Complex laparoscopic motor skills: suturing and knot tying
 - Exposure: planning integrated action of scope, assisting instruments, and surgeon’s action to create and maintain access to operating space
- Knowledge of performance possible with behavior recognition
- Guidance possible with augmented visual and haptic information

A Tutorial on Surgical Simulation: Past, Present, and Future – MMVR 2002

Performance Metrics: Perceptual-Motor Metrics

- Time
 - But the fastest surgeon is not necessarily the best!
- Accuracy
 - Position
 - Trajectory
 - Unintended contact
 - Force
- Task-based criteria
 - Successful result
 - Avoidance of undesired events

A Tutorial on Surgical Simulation: Past, Present, and Future – MMVR 2002

Validation

- Reliability
 - Test - retest
 - Internal consistency within test
- Content validity
 - Are the measures tested within the simulation appropriate to the task to be trained, e.g. as determined by a task analysis

A Tutorial on Surgical Simulation: Past, Present, and Future – MMVR 2002

Validation

- Construct validity
 - Does the test measure the quality it’s supposed to?
 - E.g., does an expert surgeon perform better in the simulation than a novice?
 - Many demonstrations of construct validity for research and commercial simulations

A Tutorial on Surgical Simulation: Past, Present, and Future – MMVR 2002

Validation

- Concurrent validity
 - Does performance in the simulation correlate with performance in the real environment?
- Predictive validity
 - Can performance in the simulation predict future performance in the real environment?
 - Pre-assessment: can you predict whether a medical student could become a successful surgeon?

A Tutorial on Surgical Simulation: Past, Present, and Future – MMVR 2002

Validation

- Training transfer
 - This is what's really important
 - Does training in a simulation improve performance in the real environment?
 - Very few published studies so far testing transfer from surgical simulations
